

MARKETMIND AI

Demo Runbook

A scripted walkthrough of the full product boundary

Contents

Preconditions	3
1. Opening	3
2. Discovery	3
3. Strategy	4
4. Content	4
5. The publish/export boundary	4
6. Monitor and Improve	4
7. Closing	5
Rehearse a fresh journey (cold start)	5
Troubleshooting during the demo	5

Preconditions

Complete these before the demo:

- Full stack running: `npm run dev:full` (Postgres, Redis, Qdrant, API, AI, web).
- Migrations applied and knowledge synced: `npm run strategy:knowledge:sync:local`.
- A seeded owner account with a confirmed Business Profile ready, so the demo starts at Strategy rather than a cold Discovery interview (see "Rehearse a fresh journey" below to show Discovery live).
- `apps/api/.env` and `services/ai/.env` configured (see the MarketMind AI User Guide, section 2).
- Browser at `http://localhost:3000` with a fresh profile; Arabic locale for the RTL pass, English for the second pass.

Before starting, confirm which publishing path the demo will show:

- Real n8n/Meta publish (only if a real, owner-authorized target and credentials are ready), or
- Checksum export (always available), or
- Labeled simulation (clearly announced).

Do not imply a real publish when showing export or simulation.

1 Opening (30s)

Say: "MarketMind AI is an Arabic-first workspace that takes an Egyptian small business from a confirmed profile to an approved, publishable week of content, with the owner approving every consequential step."

Show: the home screen, then switch Arabic ⇌ English once to demonstrate the RTL flip.

2 Discovery

If showing live:

1. Start a new Discovery interview.
2. Answer two or three questions in Arabic (for example, a café: name, location, weekday-foot-traffic goal, limited budget).
3. Point out that the system asks one clear question at a time and records unknowns.
4. Confirm the Business Profile.

If pre-seeded: open the confirmed profile and summarize what it captured.

Talking point: "The profile is the contract. Nothing moves forward until the owner confirms it."

3 Strategy (90s)

- 1. Trigger strategy generation.
- 2. While it runs, explain the curated-RAG retrieval: "The strategy is grounded in a reviewed Arabic/English marketing knowledge base, with citations."
- 3. Show the result: goal, audience, recommended platforms (for example, Instagram and Facebook), tone (Egyptian Arabic), themes, a 4-week plan plus a 12-week overview, budget direction, and KPIs.
- 4. Point to the citations, assumptions, knowledge gaps, and blockers: "The plan shows uncertainty rather than hiding it."
- 5. Approve the strategy (or show edit/reject first, then approve).

4 Content (60s)

- 1. Open Week 1 content.
- 2. Show 3-5 posts: Arabic and English captions, an image idea or generated asset, a short-video script, and posting notes.
- 3. Approve a single post (and optionally a whole week).
- 4. Emphasize: "Auto-generation makes drafts only; it never approves or publishes."

5 The publish/export boundary (90s)

This step is the approval boundary.

- 1. Open the approved post as a publication candidate.
- 2. Walk the three paths:

Path	Show	Label
Export	Download the checksum-addressed package	"This is an export; nothing was published."
Real publish	(only if ready) approve exact candidate + target + mode + schedule	"This is a real publish to your Facebook page."
Simulation	Run the deterministic demo simulation	"This is a clearly labeled simulation; no real account was touched."

Say explicitly: "Publishing is not an AI agent. It is a deterministic, approved action."

6 Monitor and Improve (30s, optional)

- 1. Show a `MetricSnapshot` for a real published post (Facebook Insights, 24h/72h/7d ages).
- 2. Show an `OptimizationProposal` (hook/CTA suggestion) and approve it for one future draft.
- 3. Note: fixtures never appear as live analytics.

7 Closing (30s)

Say: "One owner, one business, one guided journey. The AI does the work, and the owner keeps control."

Rehearse a fresh journey (cold start)

To demo Discovery from scratch:

- 1. `npm run docker:strategy:up && npm run prisma:deploy`
- 2. Create a new owner account (Google OAuth, local) and start Discovery.
- 3. Complete the interview, confirm the profile, then continue from section 3.

Troubleshooting during the demo

Issue	Fix
Strategy returns empty	run <code>npm run strategy:knowledge:sync:local</code>
Qdrant unreachable	<code>npm run docker:strategy:up</code>
Image generation fails	confirm <code>IMAGE_MODEL=google/gemini-3.1-flash-image</code>
Slow UI	the first compile on an external drive is slow; pre-warm each page once
