1 Summary

MarketMind AI helps small and medium businesses (SMEs) in Egypt plan, create, publish, and improve their social media marketing with AI assistance, while keeping the business owner in control of consequential decisions.

باختصار: منصة عربي أولاً بتساعد أصحاب المشاريع الصغيرة والمتوسطة في مصر يخططوا وينتجوا وينشروا ويحسنوا تسويقهم على السوشيال ميديا بالذكاء الاصطناعي — مع بقاء القرار المهم في يد صاحب المشروع.

2 Problem statement

Egyptian SMEs face a structural gap in marketing:

- **Cost** — hiring an agency or a full-time marketer is out of reach for most small businesses.
- **Time** — owners already run the daily operation, leaving no spare capacity for planning and content.
- **Skill** — social media guidance is largely English-language and platform-specific, and most owners cannot translate it into a plan that works for their business.
- **Trust** — generic AI tools produce content with no connection to the actual business, its offers, its audience, or its budget, and they publish without a human in the loop.

The result is inconsistent posting, wasted budget, and no way to know what is working.

3 Target users

Small and medium businesses in Egypt, across industries: retail, food and hospitality, services, education, healthcare, and others. The system is industry-neutral; a café is used only as an illustrative example.

The target persona is a business owner (not a marketer) who runs one business and one brand, has limited budget and time, prefers Egyptian Arabic (with English available), and wants practical, explainable recommendations.

4 The solution

MarketMind AI is a guided workspace that takes an owner through one complete marketing journey. The system automates selected research, strategy, and content-generation activities while the owner approves each consequential step.

4.1 Roles

Five focused AI roles and one non-AI publishing service, each with a single responsibility:

Role	Responsibility	Output	Owner approval
Discovery Agent	Understand the business	BusinessProfile	Yes — before strategy
Research Agent	Find trusted, cited evidence	ResearchPack	Sources always visible
Strategy Agent	Build the marketing plan	StrategyPlan	Yes — approve, edit, or reject
Content Agent	Create rolling weekly content	weekly ContentPack	Yes — per week
Optimization Agent	Suggest future improvements	OptimizationProposal	Yes — one future draft only
Publishing Service	Publish or export approved content	publication result	Yes — before any publish

HUMAN APPROVAL REQUIREMENT

Anything that can affect the real business — content, publishing, or strategy direction — requires clear human approval. The AI does not publish or change direction on its own.

4.2 Key characteristics

- **Arabic-first** — bilingual Arabic/English with correct RTL throughout.
- **Explainable** — recommendations cite their sources; assumptions, knowledge gaps, and blockers are shown rather than hidden.
- **Evidence-grounded** — strategy is supported by a curated, reviewed knowledge base (RAG) and limited trusted web research.
- **Owner control** — approval gates at each consequential step.
- **Labeled simulation** — where a real integration is not yet available, behavior is explicitly labeled as simulation rather than presented as real.

5 MVP journey

1. **Discover** — a short bilingual interview builds a confirmed Business Profile.
2. **Research** — trusted, cited marketing context (curated RAG first, limited web search when needed).
3. **Strategize** — a practical 12-week marketing strategy (goal, audience, platforms, tone, themes, budget direction, KPIs, citations).
4. **Create** — rolling weekly content (3–5 posts per week, Arabic/English captions, image ideas, short-video scripts).

- 5. **Publish or export** — deterministic publishing through an approved n8n/Meta workflow, or a checksum-addressed export, or a clearly labeled simulation.
- 6. **Monitor** — read-only Facebook Page Insights for posts MarketMind actually published (test fixtures never appear as live analytics).
- 7. **Improve** — an evidence-backed hook/CTA suggestion, applied only after owner approval and only to one eligible future draft.

Out of scope (deferred)

Subscriptions and payments, agency dashboards, multiple businesses per account, role-based access control, influencer matching, TikTok publishing, paid-ads execution, full video production, and native mobile apps.

6 Value proposition

For the owner	Description
Affordable	Expert-level planning and content at a fraction of agency cost.
Fast	One guided journey from no clear starting point to a publishable week.
Grounded	Every recommendation ties back to the business, its offers, audience, and budget.
Safe	Nothing reaches a real account without explicit approval.
In their language	Egyptian Arabic first, English available.

7 Business case

- **Market size** — Egypt has one of the largest SME populations in the region, concentrated in retail, food, and services, the vast majority of which are under-served by affordable marketing tools.
- **Demand pull** — social media is the dominant discovery channel for Egyptian consumers; owners know they must be present but lack the capacity.
- **Unit economics** — AI generation is near-zero marginal cost; the product sells a guided, approved outcome (a real plan and real content), not raw tokens.
- **Defensibility** — the primary differentiator is the curated Arabic marketing knowledge base, the owner-in-control workflow, and honest, explainable output, rather than the underlying model.
- **Path to revenue** — the next planned slice is a prepaid points-wallet billing model (bundles, ledger, reserve/refund) tailored to Egypt-friendly gateways; documented in the sprint-6 architecture and excluded from the MVP demo.

8 Domain fit

Content Creation and Marketing. The product spans the full content lifecycle (plan, create, publish, measure, improve), which maps directly to the ITI submission domain.

This document describes the current product and available evidence. Simulated or demo-only behavior is labeled as such. See the MarketMind AI User Guide, Presentation, Demo Runbook, and Demo Video Script for the operational deliverables.
